PW 3 - Isometric Game Scene

Goal:

Implement an isometric game scene with a moving character.

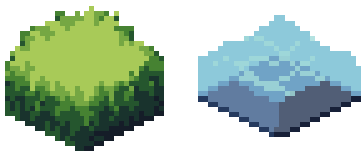

Isometric Map Visualization:

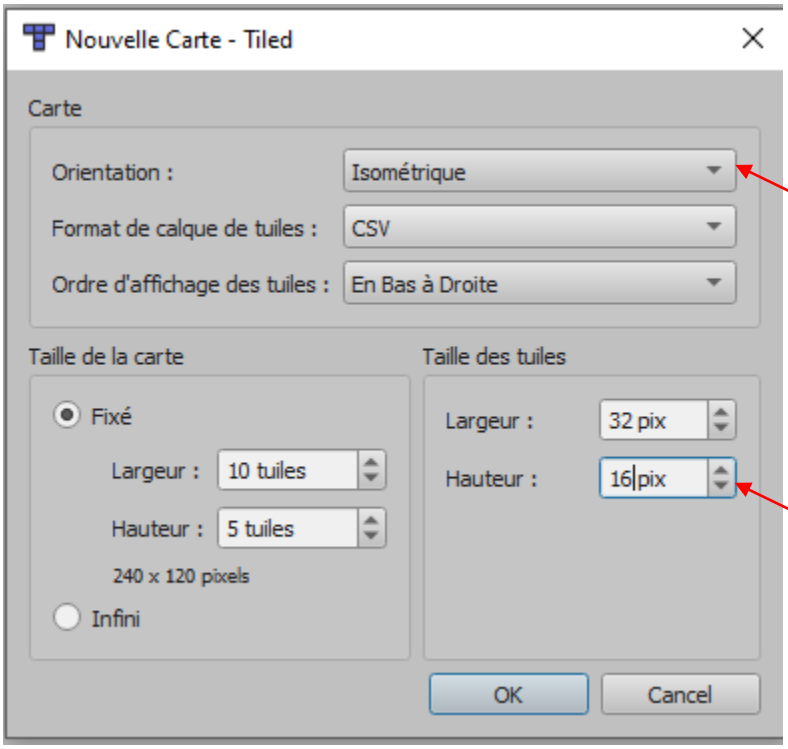

Use « Tiled » to build your own *isometric* game map then display it on HTML page using « Canvas » and Javascript.

1. Import the provided tileset “isometric_tileset.png” on « Tiled» to draw a game map. Export the game map into a .csv file.

   Tiles are of size 32x32.

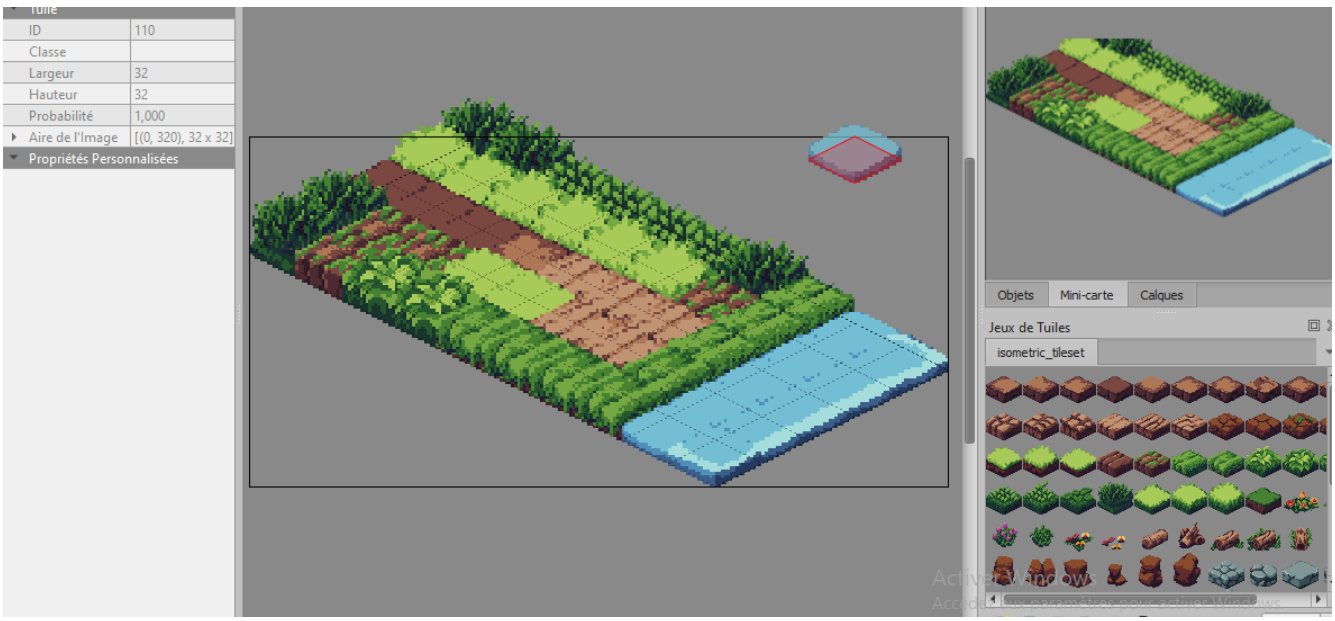

Creation of isometric map:

Change orientation from orthogonal to isometric

The height of the tile on the map is half its actual height

Example:

2. You have the choice to either use the tileset or the individual tiles from the folder. Change the starter code "isometric_map.html" accordingly. The starter code gives an example using only two tiles from the tileset. It also presents a different approach of defining a game map: a 2D array (matrix) instead of 1D array.
    a. If you use the tileset, change the code so that it loads only the tielset image "isometric_tileset.png" and the loop will take only a portion from it to draw a specific tile;
    b. If you choose to use the individual tiles from the folder, change the code so that "TabOfTiles" would contain all the names of the images.
3. Display your game map in an HTML page using « Canvas » and Javascript.
4. Make the canvas size smaller to visualize only a portion of the game map.
5. Implement tiles scrolling.

Isometric Sprite Visualization:

Use the code in "isometric_sprite.html" to implement movement of the character from the given isometric spritesheet "Character0_Run.png" . Unlike in traditional orthogonal games, the sprite moves in different directions.
